

ECOSINKS Copper - Cleaning and Care

ECOSINKS copper pure solid copper and will build an antibacterial Patina over time, typically about a year. With the patina fully developed, copper will have a somewhat darker, beautiful antique brown finish.

During the Patina building process, the copper will be affected by different materials - even water - as the Patina oxidizing process takes place. This weathered finish is not even but has light and dark tones that complement each other and create the unique effect of copper.

How to Care for Your Sink

Wipe off standing water to minimize spotting during the Patina building process

Wash with soap, water, and a soft cloth or sponge

NEVER use anything abrasive - this includes Soft Scrub, Clorox or Drano type products

Additionally, wash out acidic materials (citrus, tomatoes, industrial soaps, whitening tooth paste, etc.) to minimize spotting

Allow hot pots or pans to cool slightly before placing them in the sink

Avoid leaving dishes, glasses, pans, etc. for long periods of time

Recognize that a copper finish is a living finish which will age naturally - the early spotting and color variations are due to changes in the Patina oxidation and will fade into the Patina with time - be patient and do not use metal polishes to remove spots.
