

How Do the Posts and Digless Anchor Systems work?

The Problem?

For the past 100 years or so, driving an anchor (or pipe) deep into the ground has been known as a great way to install a fence post versus having to dig holes and use concrete. But up until now, there has always been at least two problems. These two problems are why people still have to dig holes and use concrete to this very day.

Solution 1 - The Leveling Donut

It's fairly difficult to drive an anchor into the ground perfectly straight up and down. Trust me, over the past twelve years I've driven thousands of anchors into the ground using both air-driven and manual pounders, so I know this from experience.

That's why I invented and patented the Leveling Donut. Think of this as your friend, helping you compensate for an anchor that you have driven into the ground slightly crooked. You simply adjust it to level from the Anchor Positioner 360 degrees as needed, and then sleeve over it with your visible fence post (see next page).

Solution 2 - The Anchor Positioner

Your anchor will tend to jump around during the first few strikes into the ground and lose its intended position. The Anchor Positioner will eliminate this by holding the tip of your anchor firmly in place as it initially penetrates into the ground. This device also has markers where your horizontal fence rail will sit as a temporary spacer to identify the exact location of your next anchor. This will save you from having to use a clumsy tape measure. The last benefit of this device is the ability for you to determine your post elevation by sliding the device either up or down the anchor shaft to adjust the overall height of your finished fence post. Adjusting the Anchor Positioner is much easier than trying to adjust or cut down your actual fence post.

I'm betting with a little bias that these two clever little devices are going to change how homeowners install their fencing for generations to come. In fact, I can guarantee it...because they already are.
